

How to configure ReutersBridge as NT service

In the general case, to work with ReutersBridge like a windows service could be used such command line:

```
rem Service setup
ReutersBridge --name <Service name> --config <config file name> --run install

rem Service remove
ReutersBridge --name <Service name> --run uninstall
```

If **--name** is missing - default value **ReutersBridge** will be used.

If **--config** is missing - default value **<path to ReutersBridge.exe binary>/config.cfg**

Attention: for correct working of ReutersBridge as a service, all paths in all config files should be absolute.

Running of ReutersBridge as a service is only possible through SCManager interfaces:

Use SCManager to start the service:

- services.msc GUI interface
- [net cli](#)
- [sc cli](#)
- [SCManager api](#)
