

# How to configure paths to FIXEdge log files

The **FIXEdge** has the option to configure log files names and paths to them.

The log file name is composed of two parameters in **FixEdge.properties** file: Log.File.RootDir and Log.File.Name.

In order to use relative paths, you should specify the root directory (using the Log.File.RootDir parameter) and the file name (using the Log.File.Name parameter).

Example:

```
Log.File.RootDir=/mnt/storage/fixedge_dev/FixEdge1/log  
Log.File.Name=FixEdge.log
```

In order to use absolute paths, you should leave the Log.File.RootDir parameter empty and you should specify the whole path to the log file (using the Log.File.Name parameter)

Example:

```
Log.File.RootDir=  
Log.File.Name=/mnt/storage/fixedge_dev/FixEdge1/log/FixEdge.log
```
